

FibroTech wood-wool cement OPERATION & MAINTENANCE

Instructions

These are our instructions for use and maintenance of FibroTech wood-wool cement after installation.
More information is available at www.fibrotech.co.uk

After installation

Following installation of FibroTech ceilings, vacuum-cleaning the ceiling is recommended. That will remove any dust from cutting and screwing. Use a brush nozzle.

In case of streaks or dirt on FibroTech wood-wool cement boards during installation, remove with sandpaper, grit 40, or with a firmly wrung cloth. If the panels are painted, you can buy FibroTech touch-up paint for the boards.

FibroTech wood-wool cement boards require no more cleaning or care than other products. Clean as required. Use a vacuum cleaner or a dust brush.

If unpainted boards have been installed and you would like to paint the panels at a later time, please contact the closest dealer/painter for assistance.

If you would like to paint the boards yourself, use a paint roller with long bristles or a hand-held paint sprayer. Water-based paint does not reduce the sound-absorbing properties.

Use/operation and maintenance

FibroTech wood-wool cement boards usually do not require subsequent maintenance. However, we recommend cleaning, as with any other surface, as required. Use the brush nozzle of the vacuum cleaner or wipe off with a firmly wrung cloth.
